Fig. 1.15, if its mass is η times as great as the mass of bar 1 and the angle that the inclined plane forms with the horizontal is equal to α. The masses of the pulleys and the threads, as well as the friction, are assumed to be negligible. Look into possible cases.

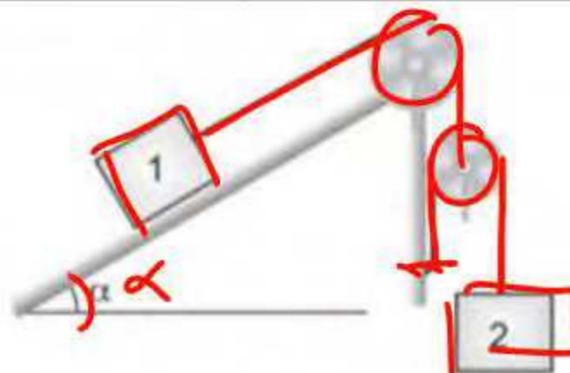

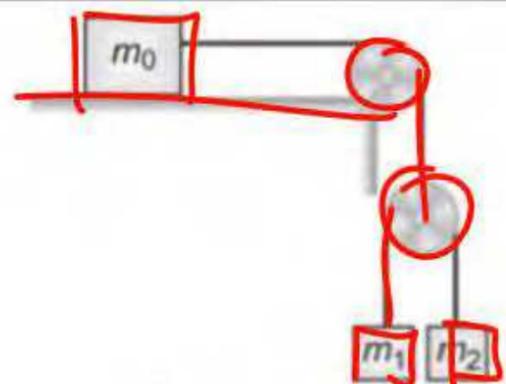

Fig. 1.15   Fig. 1.16

Ans : **72.** $w = 2g\,(2\eta - \sin\alpha)/(4\eta + 1)$.

68. At the moment $t = 0$ the force $F = at$ is applied to a small body of mass m resting on a smooth horizontal plane (a is a constant).

The permanent direction of this forms an angle α with the horizontal (Fig. 1.14). Find :

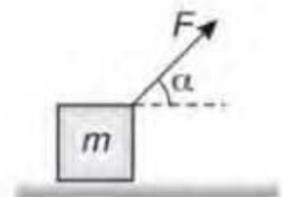

Fig. 1.13   Fig. 1.14

(a) the velocity of the body at the moment of its breaking off the plane;
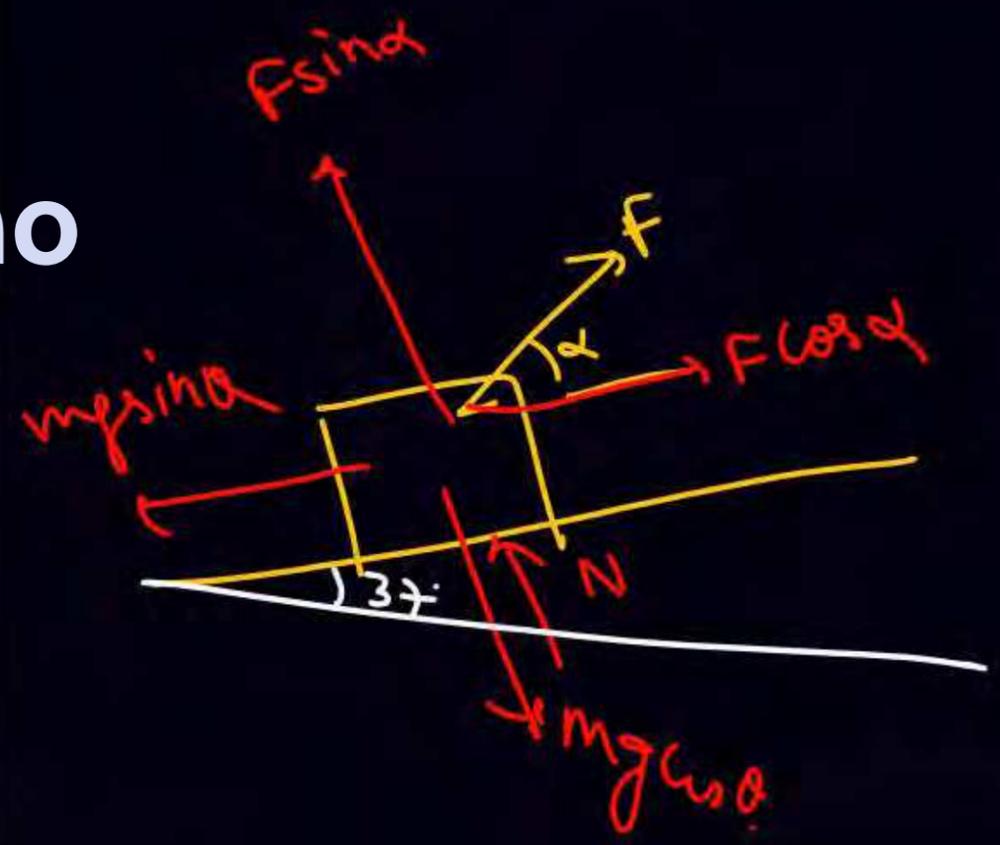

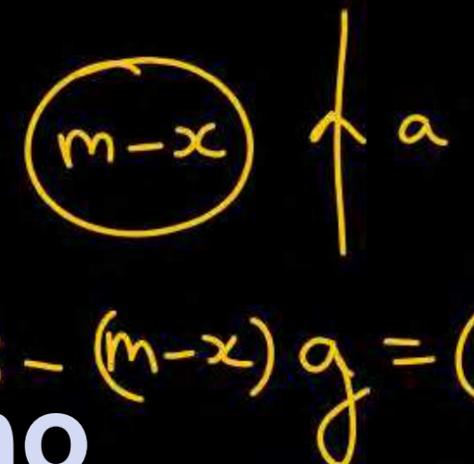

(b) the distance traversed by the body up to this moment.

Ans :   **68.** (a) $v = \dfrac{mg^2 \cos \alpha}{2a \sin^2 \alpha}$;   (b) $s = \dfrac{m^2 g^3 \cos \alpha}{6a^2 \sin^3 \alpha}$.

$$F = at$$

$$F \sin \alpha = mg \cos \theta$$

$$a = \frac{F \cos \alpha - mg \sin \theta}{m}$$

59. An aerostat of mass m starts coming down with a constant acceleration w. Determine the ballest mass to be dumped for the aerostat to reach the upward acceleration of the same magnitude. The air drag is to be neglected.

$$mg - B = ma$$

$$B - (m-x)g = (m-x)a$$

Statement-I: An elevator can go up or down with uniform speed when its weight is balanced with the tension of its cable.

Statement-II: Force exerted by the floor of an elevator on the foot of a person standing on it is more than his/her weight when the elevator goes down with increasing speed.

In the light of the above statements, choose the correct answer from the options given below:

[24 January 2023 - Shift 1]

1 Both statement I and statement II are false

2 Statement I is true but Statement II is false

3 Both Statement I and Statement II are true

4 Statement I is false but Statement II is true
